## $\Lambda$-algebras

$\Lambda$ a set, $S$ a partial semigroup, and $X$ a set
A $\Lambda$-algebra over $S$ based on $X$ is an assignment to each $\lambda \in \Lambda$ of a function from a subset of $X$ to $S$ such that for $s_{0}, \ldots, s_{k} \in S$ and $\lambda_{0}, \ldots, \lambda_{k} \in \Lambda$ there exists $x \in X$ with $s_{0} \lambda_{0}(x), \ldots, s_{k} \lambda_{k}(x)$ defined.

A $\Lambda$-algebra over $A$ based on $X$ is total if $A$ a semigroup and the domain each $\lambda \in \Lambda$ is equal to $X$.

A $\Lambda$-algebra is point based if it is total and $X$ consist of one point, usually denoted by $\bullet$.
$\mathcal{A}$ and $\mathcal{B}$ are total $\Lambda$-algebras with $\mathcal{A}$ being over $A$ and based on $X$ and $\mathcal{B}$ being over $B$ and based on $Y$.

A homomorphism from $\mathcal{A}$ to $\mathcal{B}$ is a pair of functions $f, g$ such that $f: X \rightarrow Y, g: A \rightarrow B, g$ is a homomorphism of semigroups, and, for each $x \in X$ and $\lambda \in \Lambda$, we have

$$
\lambda(f(x))=g(\lambda(x))
$$

# A total $\Lambda$-algebra from a $\Lambda$-algebrafollowing Bergelson, Blass, Hindman 

$\mathcal{S}$ a $\Lambda$-algebra over $S$ based on $X$
$\gamma X$ is the set of all ultrafilters $\mathcal{V}$ on $X$ such that for $s \in S$ and $\lambda \in \Lambda$

$$
\{x \in X: s \lambda(x) \text { is defined }\} \in \mathcal{V}
$$

$\gamma S$ is the set of all ultrafilters $\mathcal{U}$ on $S$ such that for $s \in S$

$$
\{t \in S: s t \text { is defined }\} \in \mathcal{U}
$$

$\gamma S$ is a semigroup with convolution: $(\mathcal{U}, \mathcal{V}) \rightarrow \mathcal{U} * \mathcal{V}$, where

$$
C \in \mathcal{U} * \mathcal{V} \Longleftrightarrow\{s \in S:\{t \in S: s t \in C\} \in \mathcal{V}\} \in \mathcal{U}
$$

In other words,

$$
C \in \mathcal{U} * \mathcal{V} \Longleftrightarrow \forall^{\mathcal{U}} s \forall^{\mathcal{V}} t(s t \in C)
$$

Each $\lambda$ induces a function from $\gamma X$ to $\gamma S$ by the formula

$$
C \in \lambda(\mathcal{V}) \text { iff } \lambda^{-1}(C) \in \mathcal{V}
$$

This procedure gives a total $\Lambda$-algebra $\gamma \mathcal{S}$ over $\gamma S$ based on $\gamma X$.

## Theorem

Assume we have a $\Lambda$-algebra over $S$ and based on $X$.
A sequence $\left(x_{n}\right)$ of elements of $X$ is basic if for all $n_{0}<\cdots<n_{l}$ and $\lambda_{0}, \ldots, \lambda_{I} \in \Lambda$

$$
\begin{equation*}
\lambda_{0}\left(x_{n_{0}}\right) \lambda_{1}\left(x_{n_{1}}\right) \cdots \lambda_{l}\left(x_{n_{l}}\right) \tag{1}
\end{equation*}
$$

is defined in $S$.

Assume we additionally have a point based $\Lambda$-algebra $\mathcal{A}$ over $A$.
A coloring of $S$ is $\mathcal{A}$-tame on $\left(x_{n}\right)$ if the color of elements in (1) depends only on

$$
\lambda_{0}(\bullet) \lambda_{1}(\bullet) \cdots \lambda_{l}(\bullet) \in A
$$

provided $\lambda_{k}(\bullet) \cdots \lambda_{l}(\bullet) \in \Lambda(\bullet)$ for all $k \leq I$.

## Theorem (S.)

Fix a finite set $\Lambda$. Let $\mathcal{S}$ be a $\Lambda$-algebra over $S$, and let $\mathcal{A}$ be a point based $\Lambda$-algebra. Let $(f, g): \mathcal{A} \rightarrow \gamma \mathcal{S}$ be a homomorphism.
Then for each $D \in f(\bullet)$ and each finite coloring of $S$, there exists a basic sequence $\left(x_{n}\right)$ of elements of $D$ on which the coloring is $\mathcal{A}$-tame.

## The goal: produce homomorphisms from point based algebras $\mathcal{A}$ to $\gamma \mathcal{S}$

## Tensor products

Fix a partial semigroup $S$.
$\Lambda_{0}, \Lambda_{1}$ finite sets
$\mathcal{S}_{i}$, for $i=0,1, \Lambda_{i}$-algebras over $S$ with $\mathcal{S}_{i}$ is based on $X_{i}$

Put

$$
\Lambda_{0} \star \Lambda_{1}=\Lambda_{0} \cup \Lambda_{1} \cup\left(\Lambda_{0} \times \Lambda_{1}\right)
$$

Define

$$
\mathcal{S}_{0} \otimes \mathcal{S}_{1}
$$

to be a $\Lambda_{0} \star \Lambda_{1}$-algebra over $S$ based on $X_{0} \times X_{1}$ as follows: with

$$
\lambda_{0}, \lambda_{1},\left(\lambda_{0}, \lambda_{1}\right) \in \Lambda_{0} \star \Lambda_{1}
$$

associate partial functions $X_{0} \times X_{1} \rightarrow S$ by letting

$$
\begin{aligned}
\lambda_{0}\left(x_{0}, x_{1}\right) & =\lambda_{0}\left(x_{0}\right) \\
\lambda_{1}\left(x_{0}, x_{1}\right) & =\lambda_{1}\left(x_{1}\right) \\
\left(\lambda_{0}, \lambda_{1}\right)\left(x_{0}, x_{1}\right) & =\lambda_{0}\left(x_{0}\right) \lambda_{1}\left(x_{1}\right)
\end{aligned}
$$

## Proposition (S.)

Fix semigroups $A$ and $B$. For $i=0,1$, let $\mathcal{A}_{i}$ and $\mathcal{B}_{i}$ be $\Lambda_{i}$-algebras over $A$ and $B$, respectively. Let

$$
\left(f_{0}, g\right): \mathcal{A}_{0} \rightarrow \mathcal{B}_{0} \text { and }\left(f_{1}, g\right): \mathcal{A}_{1} \rightarrow \mathcal{B}_{1}
$$

be homomorphisms. Then

$$
\left(f_{0} \times f_{1}, g\right): \mathcal{A}_{0} \otimes \mathcal{A}_{1} \rightarrow \mathcal{B}_{0} \otimes \mathcal{B}_{1}
$$

is a homomorphism.

Let $\mathcal{S}_{i}, i=0,1$, be $\Lambda_{i}$-algebras over $S$ based on $X_{i}$. Consider

$$
\gamma \mathcal{S}_{0} \otimes \gamma \mathcal{S}_{1} \text { and } \gamma\left(\mathcal{S}_{0} \otimes \mathcal{S}_{1}\right)
$$

Both are $\Lambda_{0} \star \Lambda_{1}$-algebras over $\gamma S$.
The first one is based on $\gamma X_{0} \times \gamma X_{1}$, the second one on $\gamma\left(X_{0} \times X_{1}\right)$.
There is a natural map $\gamma X_{0} \times \gamma X_{1} \rightarrow \gamma\left(X_{0} \times X_{1}\right)$ given by

$$
(\mathcal{U}, \mathcal{V}) \rightarrow \mathcal{U} \times \mathcal{V}
$$

where, for $C \subseteq X_{0} \times X_{1}$,

$$
\mathcal{C} \in \mathcal{U} \times \mathcal{V} \Longleftrightarrow\left\{x_{0} \in X_{0}:\left\{x_{1} \in X_{1}:\left(x_{0}, x_{1}\right) \in C\right\} \in \mathcal{V}\right\} \in \mathcal{U}
$$

## Proposition (S.)

Let $S$ be a partial semigroup. Let $\mathcal{S}_{i}, i=0,1$, be $\Lambda_{i}$-algebras over $S$. Then

$$
\left(f, \mathrm{id}_{\gamma S}\right): \gamma \mathcal{S}_{0} \otimes \gamma \mathcal{S}_{1} \rightarrow \gamma\left(\mathcal{S}_{0} \otimes \mathcal{S}_{1}\right)
$$

where $f(\mathcal{U}, \mathcal{V})=\mathcal{U} \times \mathcal{V}$, is a homomorphism.
$\mathcal{A}$ a point based $\Lambda$-algebra over a semigroup $A$
Fix a natural number $r>0$.
Let

$$
\Lambda_{<r}(\bullet)=\left\{\lambda_{0}(\bullet) \cdots \lambda_{m}(\bullet): m<r, \lambda_{i} \in \Lambda \text { for } i \leq m\right\}
$$

Note

$$
\Lambda(\bullet) \subseteq \Lambda_{<r}(\bullet) \subseteq A .
$$

$\mathcal{S}$ a $\Lambda$-algebra over a partial semigroup $S$
$\left(x_{n}\right)$ a basic sequence in $\mathcal{S}$
A coloring of $S$ is $r$ - $\mathcal{A}$-tame on $\left(x_{n}\right)$ if the color of elements of the form

$$
\lambda_{0}\left(x_{n_{0}}\right) \lambda_{1}\left(x_{n_{1}}\right) \cdots \lambda_{l}\left(x_{n_{l}}\right),
$$

for $n_{0}<\cdots<n_{l}$ and $\lambda_{0}, \ldots, \lambda_{\text {I }} \in \Lambda$ depends only on

$$
\lambda_{0}(\bullet) \lambda_{1}(\bullet) \cdots \lambda_{l}(\bullet) \in A
$$

provided

$$
\lambda_{k}(\bullet) \cdots \lambda_{l}(\bullet) \in \Lambda_{<r}(\bullet) \text { for all } k \leq I
$$

The following corollary of the theorem is its generalization.

## Corollary

Fix a finite set $\Lambda$ and a natural number $r$. Let $\mathcal{S}$ be a $\Lambda$-algebra, $\mathcal{A}$ a point based $\Lambda$-algebra, and $(f, g): \mathcal{A} \rightarrow \gamma \mathcal{S}$ a homomorphism. Then for each $D \in f(\bullet)$ and each finite coloring of $S$, there exists a basic sequences $\left(x_{n}\right)$ of elements of $D$ on which the coloring is $r$ - $\mathcal{A}$-tame.
